

POTASSIUM

One of the Seven Essential Macrominerals

Potassium (symbol "K") comprises 5% of the total mineral content of the body. It is a primary electrolyte and is known as a great alkalizer, important for pH and water balance. Potassium is vital in supporting cardiovascular function and muscle contraction.* In addition, Potassium plays a vital role in supporting nerve and cellular integrity by assisting the normal transfer of nutrients into and out of the cell.*

The purer the water the more efficiently minerals are activated into their electrically charged ionic state. Eniva uses OHM® water (multi-step purified water) in a unique proprietary process at Eniva's government-inspected manufacturing facility, yielding an advanced aqueous form of potassium ions (Solutomic®) in sparkling clear solution for quicker absorption than tablets or pills which must first dissolve in the digestive system before being absorbed.

Potassium Helps Support:

- Cardiovascular function*
- Blood pressure already within a normal range*
- Skin tissue*
- Nerve transduction in the body*
- Lipid levels*
- Athletic performance*
- Muscle and nerve function*
